## **AROC Impairment Specific Report, Inpatient - Pathway 3 - Orthopaedic Replacements - Anywhere Hospital, January 2014 - December 2014**

### **Abstract**

This is the third AROC Impairment Specific Report for Orthopaedic Replacements which compares YOUR FACILITY's data to ALL AROC FACILITIES data (Australia and New Zealand). Each Impairment Specific Report is structured as a series of chapters. Each report will present an overall big picture chapter on the impairment followed by a chapter looking at FIM item scoring at YOUR FACILITY as compared to ALL AROC FACILITIES data by AN-SNAP class. An outcomes analysis chapter follows with an explanatory data chapter at the end.

# Introducing the Impairment Specific Reports

This is the third AROC Impairment Specific Report for Orthopaedic Replacements which compares YOUR FACILITY's data to ALL AROC FACILITIES data (Australia and New Zealand). Each Impairment Specific Report is structured as a series of chapters. Each report will present an overall big picture chapter on the impairment followed by a chapter looking at FIM item scoring at YOUR FACILITY as compared to ALL AROC FACILITIES data by AN-SNAP class. An outcomes analysis chapter follows with an explanatory data chapter at the end.

Some facilities only have a small number of episodes. While ALL AROC FACILITIES data includes all facilities with data on this impairment, facilities will only receive this report where they have a minimum of 20 completed episodes within this impairment.

AROC welcomes your feedback on this report.

NOTE: This report should be considered in conjunction with the Benchmark Core Report for your facility.

# Data used in this report

- Data included in this report are all orthopaedic replacement episodes ending during the calendar year 2014 (1 January 2014 to 31 December 2014 inclusive).
- Commencing with the 2013 Calendar Year benchmark reports AROC is implementing a new analysis practice called Data Concatenation (refer Appendix 1 for more details about this process)
- All tables and graphs present calendar year 2014 data unless otherwise indicated, and the number of episodes from YOUR FACILITY in 2014 are provided. Where there are less than five episodes within a subgroup, summary data are not provided.
- This report is based on the V4 data set - Pathway 3 (inpatient direct care).
- Reporting on impairment codes uses the AROC V4 dataset (Appendix 2) .
- All case-mix analysis uses the version 3 AN-SNAP class (Appendix 3), introduced January 2012. Casemix adjustment is against ALL AROC FACILITIES data.
- Appendix 1 (Glossary) contains definitions of concepts referred to in this report. An understanding of these will help with interpretation of the data.
- Unit of counting is by concatenated episode, not by patient.

# Orthopaedic replacement impairment codes

Orthopaedic replacement episodes were identified as those with the following AROC impairment codes:

- 8.211 Unilateral hip replacement
- 8.212 Bilateral hip replacement
- 8.221 Unilateral knee replacement
- 8.222 Bilateral knee replacement
- 8.231 Knee and hip replacement, same side
- 8.232 Knee and hip replacement, diff sides
- 8.24 Shoulder replacement

NOTE: A list of all impairment codes can be found in Appendix 2

# Orthopaedic replacement AN-SNAP classes

Levels of functioning for orthopaedic replacements are categorised by the following version 3 AN-SNAP classes:

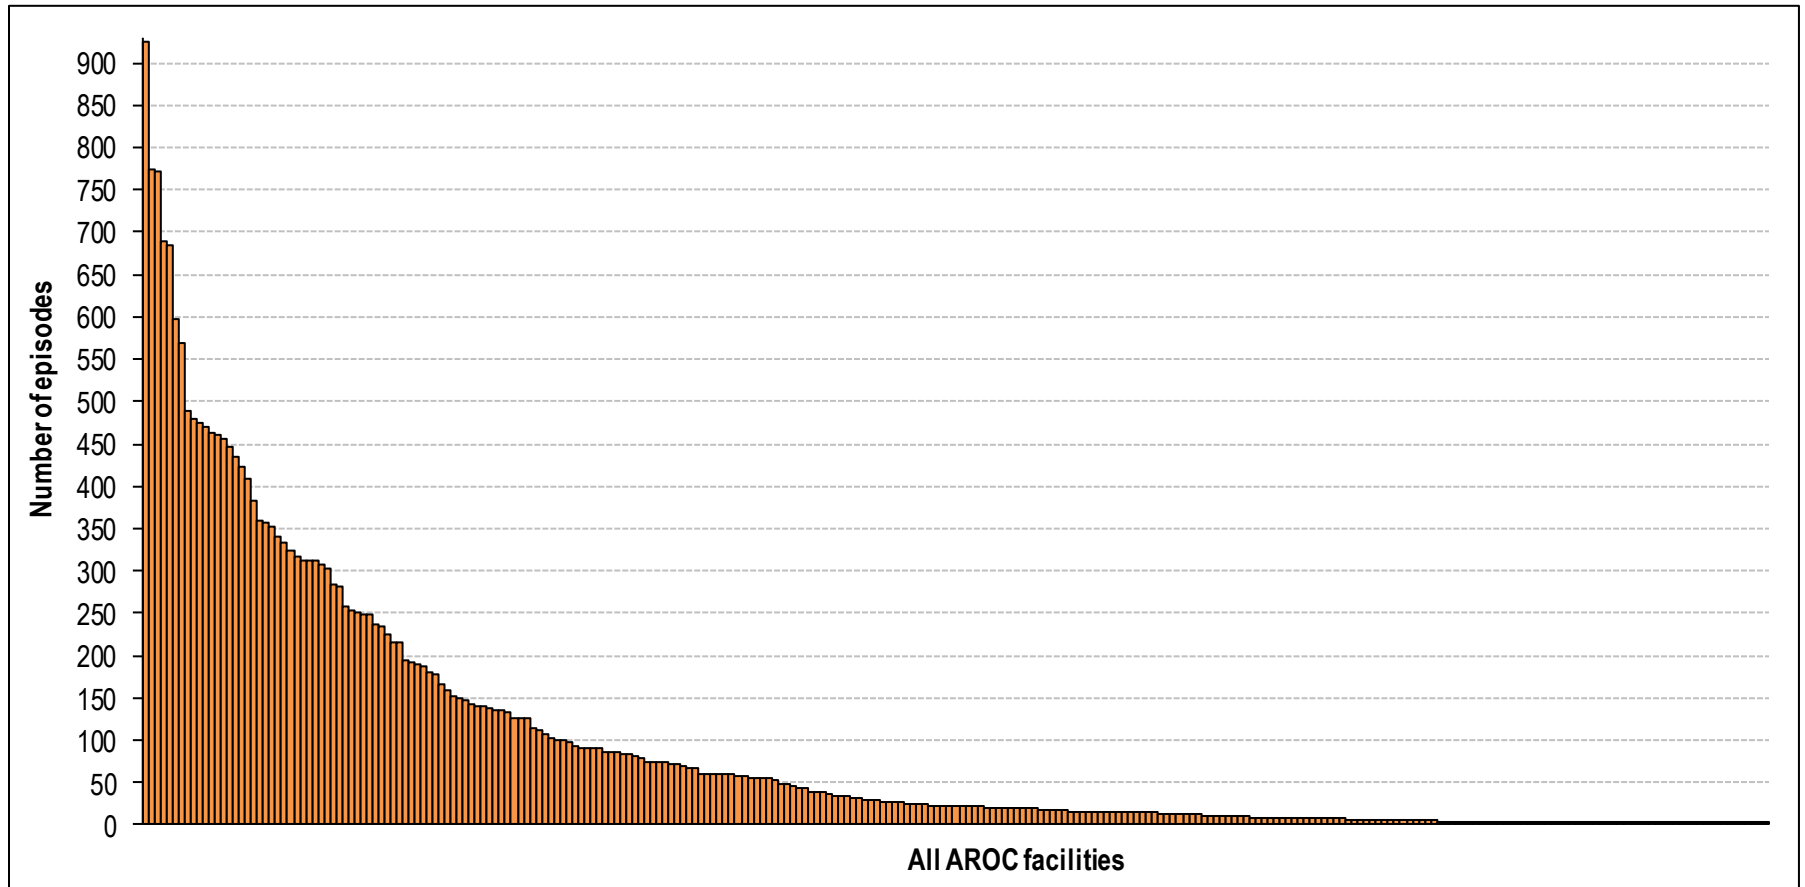

- ❖ 3-231 (FIM motor 72-91)
- ❖ 3-232 (FIM motor 49-71)
- ❖ 3-233 (FIM motor 14-48)

NOTE: A list of all AN SNAP classes can be found in Appendix 3

# Review of FIM item scoring by AN-SNAP class

# Interpreting your comparative FIM scoring charts

The FIM splat provides a graphic presentation of functional status in a radar chart. The 18 FIM items are arranged in order as 'spokes' of a wheel and the scoring levels from 1 (total dependence) to 7 (total independence) run from the centre outwards. The mean FIM item score for each item is indicated — a perfect score would be demonstrated as a large circle. The first FIM splat used in this report illustrates the FIM score change from admission to discharge at YOUR FACILITY (Figure A) — the darker shaded area represents the functional improvement at YOUR FACILITY (i.e. the difference between the mean scores on admission and discharge). The next two FIM splats compare FIM scoring on admission (Figure C) and discharge (Figure D) between YOUR FACILITY and ALL AROC FACILITIES data — differences in the two shaded areas indicate differences in mean admission/discharge scoring. Figure B is a graphic presentation of YOUR FACILITY's average FIM item scores (small bar) versus ALL AROC FACILITIES' interquartile range of FIM scores, i.e. middle 50%, (green boxes) for each FIM item at admission and discharge — ideally YOUR FACILITY's average FIM score will lie somewhere on the IQR bar of ALL AROC FACILITIES. Graphs include episodes with completed episodes and valid FIM scoring.

## ***AN-SNAP***

The Australian National Sub-Acute and Non-Acute Patient Classification (AN-SNAP) is a casemix classification for sub-acute and non-acute care provided in a variety of treatment settings. Version 3, introduced in January 2012, is used in these reports; refer Appendix 3 for the full list of classes.

## ***Change in FIM score***

The change in functional status from the beginning to the end of the episode is measured by the change in FIM score. This is calculated as the FIM score at the end of the episode minus the FIM score at the start of the episode. In some instances the change in total FIM score (the sum of items 1 to 18) is calculated. In other cases either the change in FIM motor score (the sum of items 1 to 13) or the change in FIM cognition score (the sum of items 14 to 18) is calculated.

A higher FIM score corresponds to higher level of function while a lower FIM score represents less functional independence. This means that a positive value for the change in FIM score indicates functional improvement of the client during the episode. A negative value for the change in FIM score indicates a decline in functional independence during the episode.

## ***Complete/incomplete episode***

An episode is considered “complete” for the purpose of calculating outcome statistics in this report if (A) the mode of episode end was either 1 (discharged to usual accommodation) or 2 (discharged to interim accommodation) AND total FIM score at episode end was greater than 18, or (B) the mode of episode end was 7 (change of care type within sub-acute/non-acute care) AND length of stay greater than 6 days.

## **Data Concatenation**

Increasingly some jurisdictions have introduced business rules around data collection that have resulted in episodes of rehabilitation being ended and then re-commenced a few days later. AROC definitions would record these as one episode with the period in between defined as a suspension of rehabilitation. Such business rules result in two (or more) episodes of rehabilitation being reported to AROC when only one full episode should be reported.

Whilst this happens much more frequently in some impairment groups (e.g. spinal cord injury & brain injury) it does impact all impairments to some degree. Reporting of multiple episodes impacts outcomes analysis, resulting in shorter than real length of stays and reduced FIM change being reported.

Concatenated episodes will have a revised Length of stay and FIM change (start details will be taken from the identified primary episode; end details from the identified final episode), and will also have a revised number of suspensions (being the sum across all concatenated 'submitted episodes' plus the number of breaks between 'submitted episodes') and a revised number of suspension days (being the sum across all concatenated 'submitted episodes' plus the sum of all days between 'submitted episodes').

Reported episodes to AROC are identified for concatenation based on the following rules:

- Subsequent episodes MUST have same impairment code and be from same reporting facility with same MRN and DOB
- Leading episode must be discharged into the hospital system with following episode being admitted from hospital system
- Number of days between episodes being 0-14 days for spinal and 0-7 days for all other impairments

To make it easier for AROC to identify episodes that should be concatenated in January 2014 the data item Mode of Episode Start had an additional code set value added: 9 = *recommenced rehabilitation episode following suspension*

## **FIM**

The Functional Independence Measure (FIM) is used as a tool to assess the functional independence of patients at episode start and end. Details of the specific FIM instrument used in these reports can be found in “UDSmr Adult FIM Workshop – Participant Manual, Version 5.1 (Australia). Buffalo, NY 14214: State University of New York at Buffalo; 2008.”

## **Interquartile range (IQR)**

*The middle 50% of facilities, between the 25% percentile and the 75% percentile.*

## **Length of stay (LOS)**

The length of stay (LOS) of an episode is the number of days on which care has been provided. It is calculated as the end date minus the start date, minus the number of leave days during the episode.

## **Valid FIM score**

*Each of the 18 items on admission and discharge were answered with a valid response of 1-7.*

## **Valid LOS**

*Completed episode with a length of stay ranging between 1 and 500 days.*

## **Version 4 data set**

Version 4 (V4) of the AROC dataset was introduced on 1 July 2012. V4 is designed as a bank of data items, combinations of which are used to describe 6 possible pathways of care (see the AROC website for more information about the different pathways). NOTE: This report utilises only Pathway 3 data (inpatient direct care).
