A profile of patients receiving palliative care in Australia for July - December 2018

Abstract

The Palliative Care Outcomes Collaboration (PCOC) is a national program that aims to improve the quality and outcomes of palliative care in Australia. This is achieved via a standardised clinical language that supports a national data collection. This report provides a high level profile of 23,333 patients who received palliative care during July to December 2018 and had their pain, symptom, family / carer and psychological / spiritual issues assessed as part of routine clinical care.

Keywords

Introduction

The Palliative Care Outcomes Collaboration (PCOC) is a national program that aims to improve the quality and outcomes of palliative care in Australia. This is achieved via a standardised clinical language that supports a national data collection. This report provides a high level profile of 23,333 patients who received palliative care during July to December 2018 and had their pain, symptom, family / carer and psychological / spiritual issues assessed as part of routine clinical care.

For more detailed information, including a summary of the national achievement against PCOC's 20 benchmarked patient outcome measures, please see the companion report *Patient outcomes in palliative care in Australia, July – December 2018*.

Patient characteristics

Table 1 describes the demographics of patients receiving palliative care.

Table 1 Patient demographic summary

Patient demographics		N	%
Sex	Male	12,345	52.9
	Female	10,988	47.1
Indigenous status	Aboriginal and/or Torres Strait Islander origin	361	1.5
	Not Aboriginal and/or Torres Strait Islander origin	22,165	95.0
Country of Birth	Born in Australia	14,145	60.6
	Born outside Australia	8,478	36.3
Preferred language	English	20,630	88.4
	Other than English	2,374	10.2
Primary diagnosis	Malignant	17,086	73.2
	Non-malignant	6,081	26.1
Age at beginning of episode	Average age	73.2	
	Median age	75.0	

Figure 1 Patients by sex and age group

Diagnosis

Diagnosis reflects the primary illness responsible for the person requiring palliative care. These illnesses are classified as either malignant (cancer) or non-malignant (illnesses other than cancer). Figure 2 shows how the split between malignant and non-malignant has changed since 2016, whilst Figure 3 shows a more detailed breakdown of diagnoses for the current six-months.

Self, carer(s), family, friends	2.0	1.7	1.5	1.7	1.9	1.7
Other	1.2	1.4	1.8	2.2	1.6	1.7
Not stated/inadequately described	0.1	0.1	0.3	0.4	0.5	0.7
Total	100	100	100	100	100	100

Note: Only includes episodes that started during each six month reporting period.

Figure 4 Phase as beginning of episode

The most common first phase is **deteriorating** with an average duration of 8.6 days.

Figure 5 Phase at beginning of episode - over time

Figure 6 Symptoms and problems at episode start

Despite pain often being thought to be the most distressing symptom at the end of life, the patient rated symptom with the highest number of severe scores is fatigue (5.3%). The symptom causing the least distress is nausea, rated by patients as 'absent' 76.2% of the time.

Figure 7 Moderate & severe problems at episode start (Clinician rated)

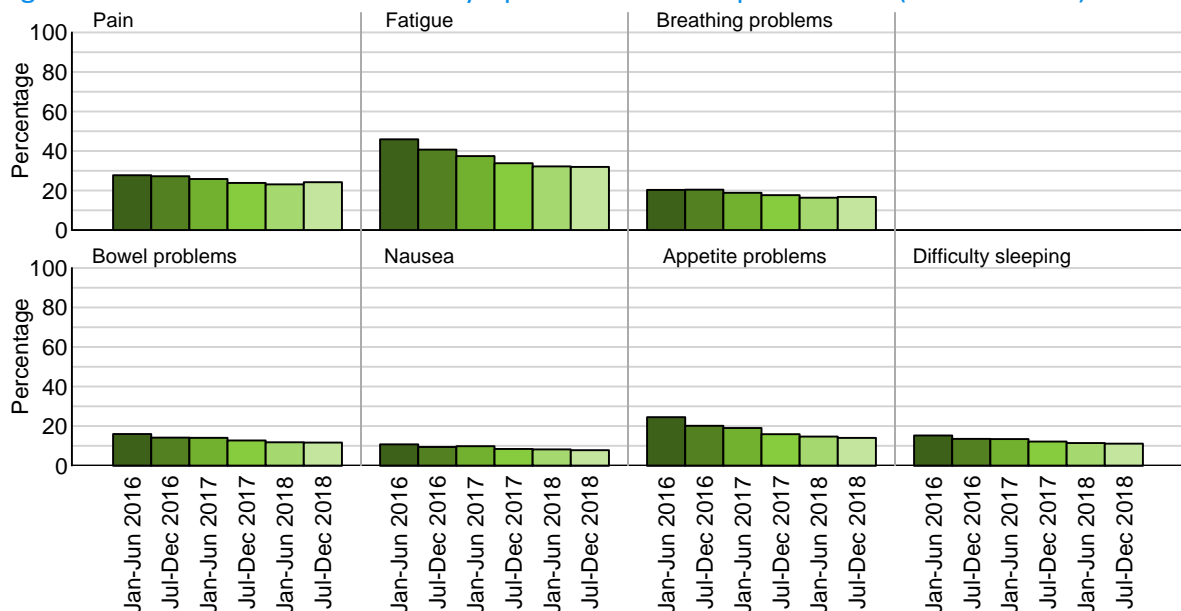

Figure 8 Moderate & severe symptom distress at episode start (Patient rated)

Palliative care phase

The palliative care phase type describes the stage of the patient's illness and provides a clinical indication of the level of care a patient requires. Table 3 describes the number of phases and phase length.

Table 3 Profile of palliative care phase

Phase type	N	%	Average phase length (days)
Stable	22,010	31.4	14.9
Unstable	11,299	16.1	2.4
Deteriorating	26,754	38.1	9.1
Terminal	10,072	14.4	2.3
All phases	70,135	100.0	8.7

Note: Phase records where phase length was greater than 90 days were considered to be atypical and are excluded from the average calculations.

The **deteriorating phase** is the most common with an average duration of 9.1 days.

Figure 9 Phase profile overtime

Place of death

For July - December 2018, 11,167 patients died in the care of a specialist palliative care service. Of these deaths, 21% occurred at the persons home, 8% in a residential aged care facility and 71% in hospital.

Phases	56,976	60,036	63,329	64,786	68,264	70,135
Average number of phases per episode*	2.3	2.3	2.3	2.3	2.3	2.3

*Calculated for closed episodes that started and ended within the reporting period and excludes bereavement phases.

Glossary

AKPS	The Australia-modified Karnofsky Performance Status (AKPS) is a measure of the patient’s performance across the dimensions of activity, work and self-care at phase start. It is a single score between 10 and 100 assigned by a clinician based on observations of a patient’s ability to perform common tasks relating to activity, work and self-care.
Episode	An episode of care is a period of contact between a patient and a palliative care service that is provided by one palliative care service and occurs in one setting. An episode of care ends when either; the patient is formally separated from the current setting of care; the patient dies; or the principal clinical intent of the care changes and the patient is no longer receiving palliative care. Under this definition, a patient receiving palliative care is likely to have more than one episode of care.
Patient	PCOC defines a patient as a person for whom a palliative care service accepts responsibility for assessment and/or treatment as evidenced by the existence of a medical record. Family / carers are included in this definition if interventions relating to them are recorded in the patient medical record. As a result, if a patient is seen in two different services with different medical record systems they will be counted twice in the total number of patients.
PCPSS	Palliative Care Problem Severity Score (PCPSS) is a clinical tool used for initial screening and ongoing coordination of specialist palliative care. Clinician rated, it facilitates the global assessment of four palliative care domains: pain, psychological / spiritual, other symptoms and family / carer.
Phase	Palliative care phase identifies a clinically meaningful period in a patient’s condition. The palliative care phase is determined by a holistic clinical assessment which considers the needs of the patients and their family and carers. The phases provide a framework for referrals, triage and care planning.
RUG-ADL	Resource Utilisation Groups – Activities of Daily Living (RUG-ADL) consists of four items (bed mobility, toileting, transfers and eating) and assesses the level of functional dependence, based on what a person actually does, rather than what they are capable of doing.
SAS	Symptom Assessment Scale (SAS) describes the patient’s level of distress relating to individual physical symptoms. The symptoms in the scale are the seven most commonly experienced by palliative patients; difficulty sleeping, appetite problems, nausea, bowel problems, breathing problems, fatigue and pain. The instrument is designed to be a patient rated tool but also allows for rating by proxy (e.g. family, carer or clinician).
