## Acknowledgments

I would like to say a very special thank you to my partner Neville Higgins for being a wonderful friend and for all your practical assistance. To Neville, our children Nikki and Joshua Higgins, and Ruth Christie, thank you for your love and enduring belief in me. Thank you to all the trauma survivors who shared some of their lives, some of their pain, and some of their wonderful humour. To Terry O'Connell and John Blackler, thank you both very much for all the many ways in which you have helped and supported me. A special thank you also to Associate Professor Linda Viney who, as my academic supervisor, gave her precious time, insisted on my best, provided invaluable wisdom, and editorial expertise.

Thank you to the members of the Police Association of New South Wales for your support and encouragement in the previous four years. Thank you to Ross Cunningham and Christine Donnelly for guiding me through the statistical analyses. Thank you to Malcolm Mearns from Datacol for assisting with the data entry and Zac Steel for helping. Thank you to Bronwyn Seaborn for agreeing to listen to some the tapes of the diagnostic interviews for the purposes of independent verification. Thank you to Peter Connor from the Police Academy of New South Wales for so capably co-ordinating the administration of questionnaires, the conducting of interviews, and for being such a great person. Thanks also to Peter Wanczura and Jane Moses for our conversations and your encouragement and support. To the members of the Police Federation of Australia and New Zealand thank you for putting the recommendations arising from this research programme on the national policing agenda. I look forward to further collaboration with your organisation. Thank you very much to the members of the Personal Construct Psychology Research Group of the Psychology

Department, of the University of Wollongong for listening so patiently to my various early attempts to formulate a model of traumatic stress reactions.

Thanks very much to the staff of the libraries of the University of Wollongong and the Australian Institute of Criminology, and Margaret Hyland (ACT Dept of Education) for your invaluable library assistance. Thanks to John Blackler, Terry O'Connell, Vicki Sokias, Peter Remfrey, Beverly Raphael, David Winter, Mark Creamer, Rue Cromwell, Dorothy Rowe, David Savage, David Alexander, Valerie Cox, Bruce Swanton, Ken Sewell, Barry Evans, Barry Gilbert, Lenore Meldrum, Chris Lidgard, Ric Marshall, Christine Nixon, Margaret Green, Peter O'Brien, Luis Botella, Wendy Moyle, Cary Cooper, Richard Bell, Seymour Rosenberg, Bill Horman, Michael Tunnecliffe, Carlene Wilson, Malcolm Cross, and anyone else I have inadvertently forgotten for sending me your papers and other useful information. Thank you to Tracy Pittard for proof-reading the final document.

Thank you to the Police Service of New South Wales for permission to conduct the studies. Thank you to the staff of Campbelltown Police station for their invaluable exposure to some of the realities of operational policing. Finally, thank you to all the trauma survivors whose insights and comments also inspired and informed the design and development of this research programme.

## Abstract

A personal construct model of traumatic stress reactions has been developed to predict the relationships between personal, trauma, and recovery factors. This model was evaluated in two studies with police. This research establishes some normative baseline epidemiological data on the levels of Posttraumatic Stress Disorder (PTSD) in novice recruits and inexperienced police. The major implications of a personal construct model of traumatisation for police and policing organisations are discussed.

The cross-sectional study included 750 recruits and inexperienced police. The repeated measures study re-assessed 193 recruits after one year of policing. Data were obtained on history, personal theories, potentially traumatising events and their subjective impact, perceived availability of social support, and trauma symptoms. The existence of PTSD was assessed by structured interview with 20% of the participants.

A negative personal theory, a family history of psychological assistance, a reported emotional abuse or neglect history, and Catholicism were significant explanatory variables. The type of trauma, a perception of life threat, total trauma exposure weighted by subjective impact, and personal identification with a traumatic event were significant predictors of trauma symptoms. In the cross-sectional study, police with one year of experience had a current PTSD prevalence rate of 6.05% compared to recruits at 3.36%. In the repeated measures study, a current prevalence rate of PTSD for experienced police officers was 8.29% compared to themselves, as recruits, at 3.36%. Trauma symptoms were associated with being a police officer with one year of operational experience. Trauma symptoms were also associated with the perceived availability of different types of social support in diverse ways. Baseline trauma symptoms did not predict trauma symptoms after a year of operational policing.

A personal construct model of traumatisation found considerable empirical support from these police studies. Psychological proximity to potentially traumatising life events, negative personal theories, and aspects of the recovery environment were related to trauma symptoms. The limitations of the findings are discussed. Fundamental systemic changes in policing environments are suggested which may help prevent traumatic stress reactions in police and facilitate their recovery from traumatic experiences.
