The research documented in this thesis has been published and presented as following:

Abstract

There is a paucity of information on how consumers perceive environmental risk as impacting on food supply and the relationship of food choices to this risk. Twenty six participants were recruited in the Illawarra region of New South Wales to be involved in this study, which was conducted over a period of eighteen months. A methodology drawing on critical social science theory was used to explore the participants' understanding of the food system and to document the influence of critical reflection over time on participants' food choices. This approach differs from surveys of consumer opinions in that, after setting the initial agenda, it allows for the participants' concerns to become the focus. For health professionals this provides a rich source of information on people's concerns about the food system and also the priority of these for the individual. Such information is invaluable for the development of collaborative projects that aim to address environmental health risks within the food system from the consumer perspective.
Acknowledgements

I wish to thank my supervisor, Dr Heather Yeatman, for her invaluable assistance in guiding me through the research process. Her insight and editorial comment greatly clarified and strengthened the presentation of this research. I would also like to thank Dr Fiona Borthwick for her critique and advice on ensuring this was constructed as an academic argument and yet one that was accessible to the reader.

My thanks also to the Faculty of Health and Behavioural Science for financial assistance that enabled me to attend two conferences in the United States to present my research. This help was very much appreciated.

A special thanks to my family for putting up with my obsessive and focussed behaviour while writing, I know that this constrained my involvement in the family activities which we value so much.
