1-(4-Chlorophenyl)-2-methyl-4-nitro-5-(1-piperidyl)-1H-imidazole

Abstract
The only specific interactions that influence the crystal packing of the title compound, C15H17ClN4O2, are weak C-H...N and C-H...Cl hydrogen bonds, even though there is a possibility of, for example, pi-pi stacking or halogen bonding. The dihedral angle between the mean planes of the imidazole and benzene rings is 59.82 (5) degrees. The length of the C-N bond connecting the imidazole and piperidine fragments is correlated with the degree of pyramidalization of the piperidine N atom.

The only specific interactions that influence the crystal packing of the title compound, C15H17ClN4O2, are weak C–H···N and C–H···Cl hydrogen bonds, even though there is a possibility of, for example, π–π stacking or halogen bonding. The dihedral angle between the mean planes of the imidazole and benzene rings is 59.82 (5)°. The length of the C–N bond connecting the imidazole and piperidine fragments is correlated with the degree of pyramidalization of the piperidine N atom.

Comment

Nitroimidazoles have been intensively investigated as radiosensitizers of hypoxic tumour cells and as veterinary drugs (Smithen & Hardy, 1982). In particular, 4-nitro-5-amino-imidazole derivatives have been relatively widely studied, due to their expected radiosensitizing activity combined with good water solubility (see, for example, Wolska et al., 1993, 1994). More recently, in the crystal structure of 1,2-dimethyl-5-morpholino-4-nitroimidazole hydrate, the interesting case of centrosymmetric–non-centrosymmetric ambiguity was found (Kubicki et al., 2003). Moreover, a number of simple 4-nitroimidazole derivatives have been used for studying different intermolecular interactions (see, for example, Kubicki, 2005, and references therein). The structure of another 5-amino-4-nitroimidazole, the title compound, (I), is reported here. The ability of 4-nitroimidazoles to undergo nucleophilic substitution has been widely investigated (see, for example, Małkosza, 1992) and provides a convenient way of modifying azole derivatives. Some amino derivatives have also been synthesized in this way (Małkosza & Białecki, 1998; Suwinski & Świerczek, 1996).

Fig. 1 shows a displacement ellipsoid representation of (I). The benzene and imidazole rings are almost perfectly planar, and the dihedral angle between them is 59.82 (5)°. The length of the C–N bond connecting the imidazole and piperidine fragments is correlated with the degree of pyramidalization of the piperidine N atom.

![Figure 1](image-url)

A view of the molecule of (I), showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level and H atoms are shown as small spheres of arbitrary radii.

The correlation between the C–N bond length and the sum of the valence angles around the amino N atom for 5-(cyclic)aminoimidazoles.

---

the maximum deviations from the least-squares planes being not larger than 0.015 (1) Å. The dihedral angle between the mean planes of these rings is 39.82 (5)°. The nitro group is also significantly twisted out of the imidazole plane, the dihedral angle between the appropriate planes being 14.7 (2)°. This value is larger than in similar compounds and is probably caused by the presence of the bulky substituent at position 5. The C—N—O angles are asymmetric, and this asymmetry is typical of 5-substituted 4-nitroimidazole derivatives (Kubicki, 2004a). The C4—N4—O41 angle (cis with respect to imidazole ring atom N3) is smaller than the angle trans to N3 (C4—N4—O42) by 1.1°. For 5-H derivatives, this asymmetry in C—N—O angles is also observed, but in reverse, i.e. the cis angle is larger than the trans one (Kubicki, 2004b).

The molecular geometry of (I) is quite typical. In this type of compound, there is an interesting correlation between the C5—N51 bond length and the sum of the bond angles around N51: the longer the bond, the larger the pyramidalization of the N atom, i.e. the smaller the sum of the bond angles. For 16 fragments of 5-(cyclic)aminoimidazoles found in the Cambridge Structural Database (CSD; November 2004 version, February 2005 updates; Allen, 2002), the correlation coefficient is 0.98 (Fig. 2), and the data for (I) fit perfectly into this relation. It might also be noted that there is no such correlation between the C5—N51 bond length and the angles around atom C5.

The piperidine ring is in a chair conformation. The asymmetry parameters (Duax & Norton, 1975) show only minor distortions from ideal C3d symmetry (the maximum value of the ΔC2 parameter is 3.83°, and of ΔC3 is −3.15°).

In the crystal structure of (I), there are infinite chains of C2—H···Cl hydrogen bonds {C(12)[R2(5)] chains along the [001] direction}. These two kinds of weak interactions close larger rings of molecules of motif R2(30) (Fig. 3). The geometric details of these interactions are given in Table 2. Interestingly, in this case no other specific interatomic interactions (e.g. π—π stacking or halogen bonds) take part in the creation of the supramolecular structure, even though these interactions could compete successfully with weak hydrogen bonding.

### Experimental

The title compound was synthesized by nucleophilic replacement of bromine at the 5-position of the imidazole ring by piperidine (see scheme). The reaction was carried out in boiling methanol with an excess of piperidine over 24 h with a high yield. In contrast with the reactivity of the 1-alkyl derivative, in which double substitution of the arene substituent significantly decreases the reactivity of the imidazole moiety. Crystals of (I) suitable for X-ray data collection were grown from a methanol solution.

### Crystal data

- **C15H17ClN4O2**
- **M_r** = 320.78
- Orthorhombic, **P2_12_2_1**
- **a** = 8.5841 (12) Å
- **b** = 9.0352 (12) Å
- **c** = 18.738 (2) Å
- **V** = 1453.3 (3) Å^3
- **Z** = 4
- **D_x** = 1.466 Mg m^-3

### Data collection

- Kuma KM-4 CCD four-circle diffractometer
- 4072 independent reflections
- 3298 reflections with **I > 2σ(I)**
- **R_{int}** = 0.027
- **θ_{max}** = 30.0°
- **θ_{min}** = 0.958, **θ_{max}** = 0.972
- 15516 measured reflections
- **l** = −25 to 23

### Refinement

- **R[F^2 > 2σ(F^2)]** = 0.031
- **wR(F^2) = 0.054**
- **S** = 0.93
- 4069 reflections
- 257 parameters
- All H-atom parameters refined

Symmetry codes: (i) x + 1, y, z; (ii) −x + 1/2, −y, z − 1/2.

The positions of the H atoms were freely refined [C—H = 0.93 (2)–1.02 (2) Å. For each group of these atoms, i.e. for the methyl group, for each CH2 group and for ring H atoms, one common Uiso(H) parameter was refined.

Data collection: CrysAlis CCD (Oxford Diffraction, 2002); cell refinement: CrysAlis CCD; data reduction: CrysAlis RED (Oxford Diffraction, 2002); program(s) used to solve structure: SHELXS97 (Sheldrick, 1990); program(s) used to refine structure: SHELXL97 (Sheldrick, 1997); molecular graphics: Stereochemical Workstation Operation Manual (Siemens, 1989); software used to prepare material for publication: SHELXL97.
