Explaining Social Exclusion in Alcohol-Related Dementia: A Literature Review

Renee Brighton, Lecturer/Research Student

and

Associate Professor Victoria Traynor,
Associate Professor Janette Curtis

School of Nursing, Midwifery & Indigenous Health,
University of Wollongong, NSW
Why research this?

- People ‘fall through the net’ – do not meet with ‘criteria’ for majority of services
- Inexperienced staff & unsuitable services do not take into account the complexities that surround people with alcohol-related dementia
- Remains the ‘hidden dementia’ in current clinical practice and the literature
What is alcohol-related dementia?

- Alcohol intrinsic to Australian culture, but large proportion population drink at levels that place them at risk of alcohol-related harm

- NHMRC (peak body who develops alcohol guidelines) found ¼ Australians at risk of alcohol-related harm

- Harms include cognitive & neurological impairment, structural brain changes = alcohol-related dementia, but degree of recovery possible

- Over 10% younger people have dementia that is alcohol-related, some research even states over 20%
What was found in the literature?

- 35 articles retrieved - quantitative and qualitative studies, systematic reviews and government reports
- Research had to be with those with a definite diagnosis of alcohol-related brain condition and/or their carers
- **6 key themes** evident in the research
Case study

- Darcy, artist, divorced 52 year-old gentleman with a 25+ year history alcoholism
- 12 year contact D&A services, over last 9 years worsening cognitive impairment noted on each contact
- Symptoms included: memory loss, difficulties mobilising, slowed thought processes, poor judgement, changes in personality, perception & behaviours
- Also experienced mild liver problems & nutritional deficits
First theme

• **Under recognition & lack of timely diagnosis**
  
  • Darcy experienced 8 years of significant cognitive impairment, but diagnosed at 45 with clinical depression
  
  • No alcohol-related brain diagnosis given until age 49, when Darcy needed constant supervision & could not adequately maintain independent living
Second theme

• **Service provision (or lack there of...)**
  
  • Darcy treated for at least 3 years by both D&A and mental health services, without either knowing about one another
  
  • No fixed abode for approximately 5 years, used up ‘quota’ of emergency accommodation
  
  • Did not meet criteria for drug and alcohol residential rehabilitation
Third theme

• **Stigma**
  
  • Darcy’s family/former friends would have ‘nothing to do with him’, related to poor behaviours from persistent alcohol abuse.
  
  • Health care workers & others called him ‘sub-human’, not deserving of love and care, due to ‘self-inflicted’ nature of his illness.
  
  • Resulted in damaging self-stigma, ‘alcoholic creep’, ‘worthless human being’, ‘did not deserve to live’.
Fourth theme

- **Homelessness**
  - Darcy homeless for 5 years, no money, no family or friends to take him in
  - Difficulty for Darcy to distinguish between right & wrong, short-term memory problems – difficulties caring for himself
  - Darcy left in an extremely vulnerable state with others taking advantage of him, loss of identity and ‘broken’ life
Fifth theme

- **Carer needs (not being addressed)**

  - Darcy’s friends found difficulty accessing services, treatment, support & any information about alcohol-related dementia

  - Friends ‘fed up’ with lack support/information and Darcy’s worsening cognitive symptoms & behavioural problems – Darcy ‘kicked out’ and homeless for at least 5 years
Sixth theme

• **Recovery pathways (also lack thereof...)**
  
  • Lack of coordinated services for Darcy = no chance of recovery
  
  • No one person/organisation coordinating care = no opportunity to stop drinking and to slow down or stop cognitive impairment
  
  • Darcy sadly died alone just short of his 53rd Birthday
Social Exclusion

- Wider marginalisation and social exclusion occurs for the majority of those with alcohol-related dementia

- The need to heal the ‘broken lives’ of these people needs to be prioritised before a reduction in this social exclusion will be seen
Specialist rehabilitation unit

- **Key principles of treatment:**
  - Staff are experienced in complexities of alcohol-related dementia - coordinate care, provide safe and therapeutic environment
  - Support for abstinence from alcohol, so that recovery a possibility
  - A rehabilitative approach to assist with independence in everyday living
  - Active family involvement, as support networks improve treatment outcomes
