ABSTRACT

This thesis is concerned with developing a dynamic long run macroeconomic model of Indonesia, focussing upon the contribution of oil developments upon that economy's income, investment, wealth, balance of payments, and trade performance. The model incorporates the main characteristics of the oil sector in the Indonesian economy, emphasising the crucial role of government in the distribution of oil production for domestic usage and for export, and the spending of oil generated revenue upon consumption (routine) and investment (development) (equivalent to a capital transfer to the private sector) expenditure. While focus is placed upon oil developments, the model is sufficiently general for analysing the economic effects arising from non oil shocks and that arising from a wide range of policy options.

A numerical simulation procedure is adopted to identify how the domestic economy is affected by oil related shocks, and how such outcomes can be altered through the adoption of alternative policy responses. The roles of alternative nominal exchange rate policies, combined with different degrees of control over international capital mobility, are also incorporated, in order to capture the impact of such policies upon the domestic economy. This is particularly prevalent in the context of an economy such as Indonesia's, which is engaging in extensive economic liberalisation.

The study indicates that the influence of the oil sector on the Indonesian macroeconomy has been significant over the long run, and that this has been more so from oil price shocks in comparison to that of oil production shocks. A dynamic and long run analysis is adopted in order to identify the most appropriate policy responses in order to moderate the possible Dutch disease effects, and to enhance the benefits arising from such oil shocks.

The major results of this study suggest that adopting a more development-oriented policy (investment) towards additional oil revenue, would moderate the Dutch disease consequences, improve the longer term economic development of the economy, and also smooth the adjustment process. The opposite would be so from stimulating consumption expenditure. Adopting a more export oriented policy towards oil production worsens the Dutch disease consequences, however this would be compensated by a greater accumulation of net foreign asset stocks and vice versa.

It is also found that a flexible exchange rate policy, combined with perfect international capital mobility, is a preferable response to an oil price increase, whilst adopting a flexible exchange rate, together with high degree of control over international capital mobility, is a preferable response to an oil production increase. Hence adopting a more market oriented policy, that leads to a greater role for the private sector and closer integration with the global market economy, is found to be preferable for the case of Indonesia.
TO THE MEMORY OF MY BROTHER AND MOTHER

ACKNOWLEDGMENTS

"In the name of Allah, Most Gracious, Most merciful. Praise be to Allah, The Cherisher and Sustainer of the Worlds" (Al Qur'an, Surat 1. Ayat 1-2),

I complete this thesis.

I would like to express my special acknowledgment and sincere thanks to Dr. Charles Harvie, the chairman of my doctoral committee, who kindly and patiently encouraged, supervised and guided me in the process of developing and writing this dissertation. He was a constant source of support from the beginning until the completion of the dissertation.

I would also like to convey my special gratitude and genuine appreciation to Associate Professor D.P. Chaudhri and Mr. E. J. Wilson, members of the supervisory committee, for their roles in giving comments, suggestions, understanding, and patience, which enabled me to successfully complete this dissertation. I am also appreciative of Associate Professor R. Castle who provided a considerable number of valuable comments and suggestions on the improvement of the content and presentation of the dissertation, and Associate Professor Tran Van Hoa who gave a number of helpful suggestions.

I would also like to thank Ms. Di Kelly and Dr. R. Witton for the editing of my English, Mr. Wolfgang Brodesser who assisted me with computing needs, Ms. Sophie Abercombie and Ms. Julie Chin who were invaluable in assisting with administrative needs and in the provision of their friendship.

Moreover I would like to express my thanks to the Head of the Bureau of Planning, Ministry of Agriculture and his staff, for giving me the opportunity to do this study, and to the Australian International Development Assistance Bureau (AIDAB) which provided me with a scholarship and to friends for their support.

Furthermore I would like to acknowledge a special debt of gratitude to my late mother for her encouragement, love and strength of spirit, and to my late father for his courage. I am also deeply indebted to my husband, Herman Zaini, for his courage and patience, to my daughter, Saddra Fitrilia, and my son Ritzy for their fun, joy and naughtiness during the duration of this thesis.

I dedicate this thesis to my late brother Budiman Thaha and to my late mother Syafiah Abbas for their commitment to society and science.
