## Abstract

Asymptotic theory is applied to examine solitary wave interaction for three higher-order model equations, which represent small perturbations to integrable equations. The higher-order equations considered are the higher-order Nonlinear Schrödinger equation and the focusing and defocusing higher-order Hirota equations. The asymptotic theory, which involves a transformation, allows the straightforward determination of parameter choices, for which the higher-order equations are asymptotically integrable, and of the higher-order phase and coordinate shifts due to the collision, in the asymptotically integrable cases. For the higher-order Hirota equations, direct soliton perturbation theory is also used, to determine the details of the evolving solitary waves; in particular analytical expressions are found for the solitary wave tails.

An important feature of the asymptotic and perturbation theories is that they allow cross-validation of the theoretical results and also allow families of asymptotic embedded solitons to be identified.

Numerical solutions of the governing equations are also obtained. For solitary wave interaction, asymptotically elastic and inelastic cases are considered. When the higher-order coefficients satisfy the appropriate algebraic relationship then the numerical results confirm the prediction of the asymptotic theory. Numerical solutions for evolving solitary waves are also used to confirm the results of the soliton perturbation theory.

# Declaration

I, Sayed M. Hoseini, declare that this thesis, submitted in partial fulfilment of the requirements for the award of Doctor of Philosophy, in the school of Mathematics and Applied Statistics, University of Wollongong, is wholly my own work unless otherwise referenced or acknowledged. The document has not been submitted for qualifications at any other academic institution.

# Acknowledgements

First of all I want to thank God and my dear wife *Somayeh Zahedi Nejad*, to whom this thesis is dedicated, for her encouragement and patience. It is the least you deserve for putting up with countless late nights, and for steadying frayed nerves.

To my dear kids, *Amir Ali* and *Fatemeh Sadat* whose love and support provided me the energy to attain my study.

To my supervisor A/Prof *Timothy Marchant* for the excellent supervision he provided and for all the help, advice and assistance which he gave besides those related to academic matters. I whole-heartedly appreciate all of this assistance. This help opened up my eyes and mind to the topic of solitary waves and his teaching led me to a deeper understanding of solitons and solitary wave interaction. He also taught me how to gain a better relationship with other people. Without his guidance, this thesis could not come to fruition.

# List of publications

The following publications have been published by the author during his studies.

[1] S. M. Hoseini and T. R. Marchant. Solitary wave interaction and evolution for a higher-order Hirota equation. *Wave Motion.*, 44:92-106, 2006.
